What can we expect from Large Language Models such as ChatGPT?

Vincent Vandeghinste (INT and KU Leuven)

In this talk we will take a peak under the hood of large language models, so we can understand what they are, and more importantly, what they are not. We briefly explain the techniques behind these models, such as machine learning, neural networks, deep learning, embeddings and transformers. As these techniques are data-driven, we discuss the importance of data selection with respect to biases and the consequences thereof in what we can and cannot expect of these models.
